AuthorWise DI²
Redacted Writing-Sample Diagnostic Report

Original shapes retained. Feature-axis labels withheld.

1. Executive summary

This report presents the supplied writing-sample shapes while excluding all feature-axis labels, identifying headings and decoder tables. The plot interiors are preserved directly from the supplied figure rather than reconstructed from a different run. Aggregate comparison results remain unchanged. The supplied candidate disposition remains INCONCLUSIVE.

2. Purpose and scope

AuthorWise DI² is an exploratory writing-style measurement system. This is a presentation derivative, not a new engine execution or independent validation. The three focal panels are labeled Writing Sample 1, Writing Sample 2 and Writing Sample 3, in reading order. The additional panel is Reference Text 1. No authorship claim follows from a generic label.

3. Anonymized source inventory

The inputs comprise three supplied figures and one supplied archive. The inventory below records the treatment of each. Original attachments remain unchanged. Full report reproducibility from this public-facing derivative is intentionally limited by the removal of feature-level data.

Input	Disposition
Supplied Figure 1	Withheld: feature labels, contribution values and geometry.
Supplied Figure 2	Exact plot interiors retained; names, axis text and identifying legends excluded.
Supplied Figure 3	Retained: aggregate exploratory corpus context; image metadata removed.
Supplied archive	Only aggregate comparison results transcribed; no raw writing, feature maps or source paths redistributed.

4. Method and feature disclosure boundary

The supplied run describes a fixed 166-feature vector and two weighting modes: equal-feature and family-balanced. The compact shape display represents only 12 axes. Its original scale, orientation and polygon pixels are retained, but all feature-axis names, feature-index keys and individual-value tables are excluded. Contribution charts and tables are withheld. Visible geometry can still be compared with previously available figures; label removal does not make the shapes secret or unlinkable.

5. Results for Writing Samples 1–3

The supplied shape panels show 883, 481 and 651 tokens for Writing Samples 1, 2 and 3, respectively, and 461 tokens for Reference Text 1. Each panel is preliminary and shows one reference, below the four-reference gate. These counts are taken from the supplied image. The archive separately reports a 390-token candidate with 20 segmented sentences and seven paragraphs. No unverified mapping of that separate candidate onto the three image panels is asserted.

6. Equal-feature versus family-balanced comparison

The four reported distances are reproduced exactly to eight decimal places. Distances under different weighting modes are not on a common calibrated scale. Changing the weighting changes the reported distance, but every supplied comparison remains INCONCLUSIVE. Smaller distances do not constitute a probability of common authorship.

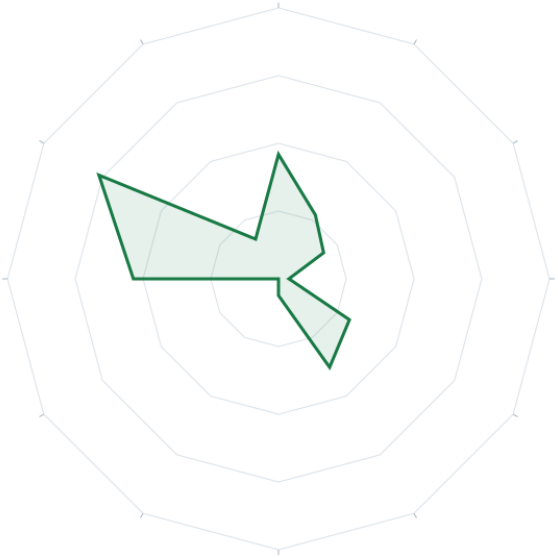

Profile	Weighting	Refs	Distance	Disposition
Book-only reference set	Equal-feature	3	0.34863542	INCONCLUSIVE
Book-only reference set	Family-balanced	3	0.70513422	INCONCLUSIVE
Mixed-reference sensitivity set	Equal-feature	4	0.30528041	INCONCLUSIVE
Mixed-reference sensitivity set	Family-balanced	4	0.67396428	INCONCLUSIVE

Unlabeled writing-sample shapes

Exact plot interiors from the supplied figure. Fixed 0–1 scale; descriptive diagnostics only. Feature-axis labels and identifying legends are excluded.

Writing Sample 1

883 tokens | preliminary | 1 reference

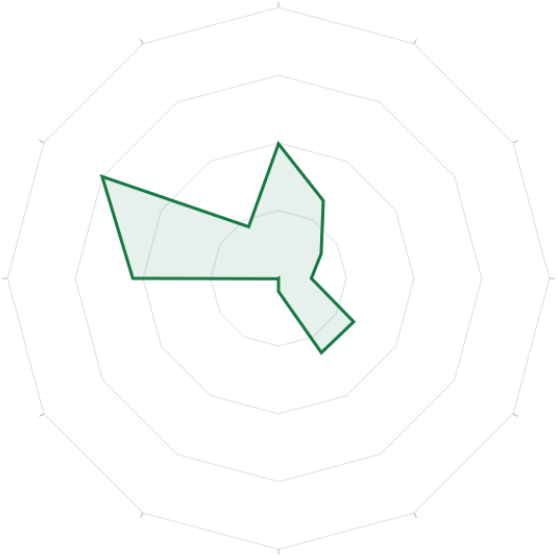

Writing Sample 2

481 tokens | preliminary | 1 reference

Writing Sample 3

651 tokens | preliminary | 1 reference

Reference Text 1

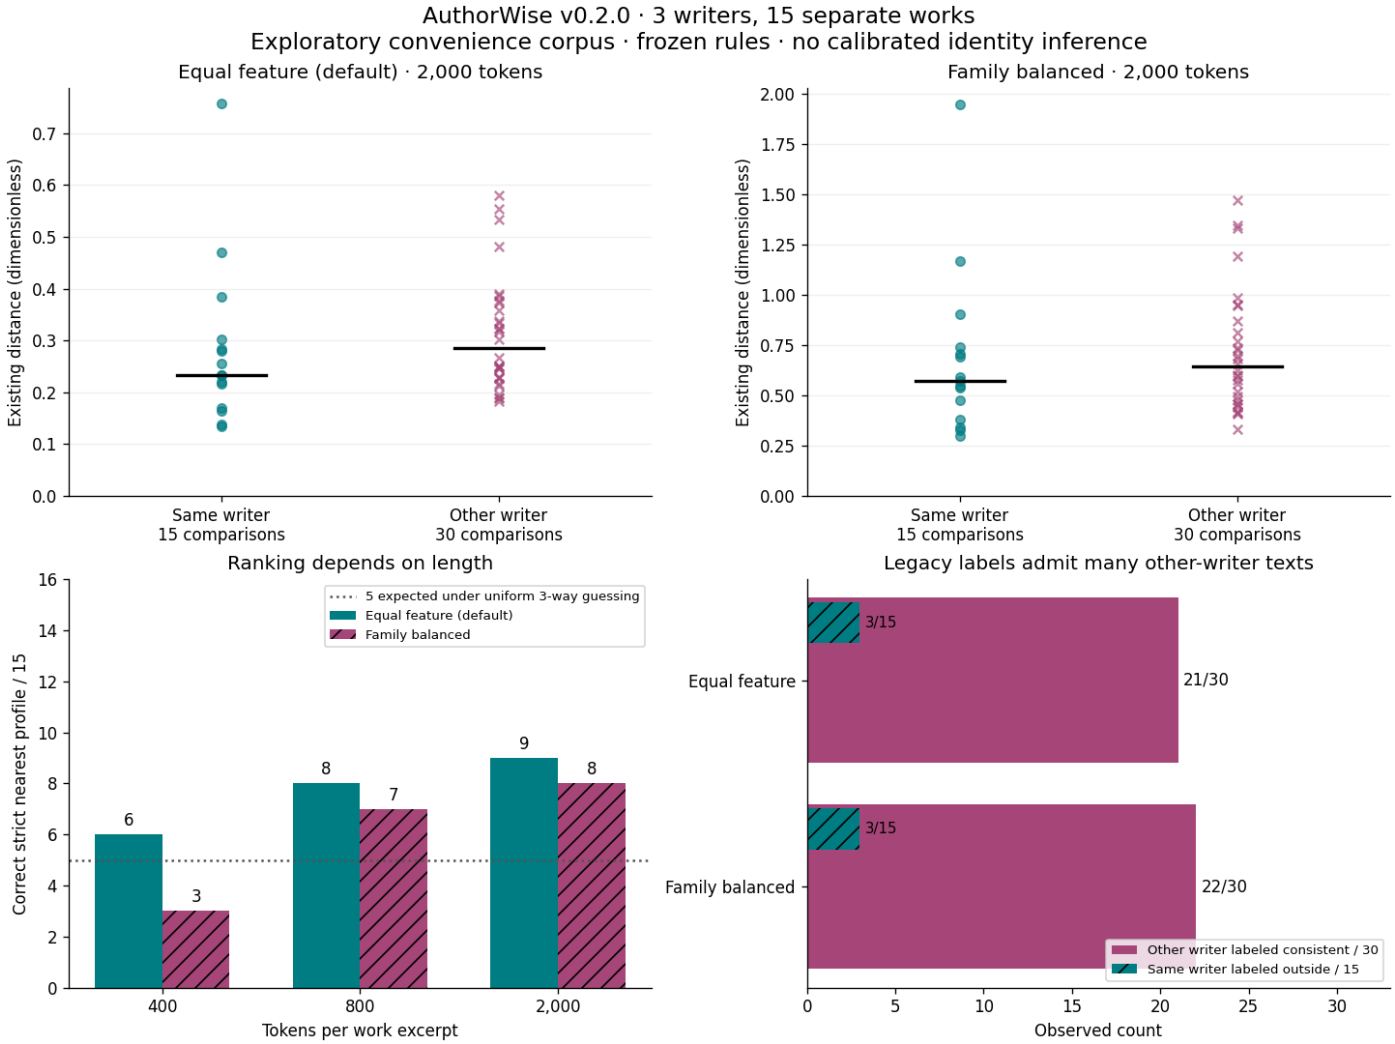

461 tokens | preliminary | 1 reference

Each panel shows one reference: preliminary and below the four-reference gate. Similar-looking shapes are not proof of authorship.

7. Interpretation of retained visual diagnostics

The retained corpus figure describes an exploratory convenience corpus of three writers and 15 works. Its same-writer and other-writer labels are supplied grouping labels, not an identification finding. The distance distributions overlap. Correct strict-nearest counts at 400, 800 and 2,000 tokens are 6/15, 8/15 and 9/15 under equal-feature weighting and 3/15, 7/15 and 8/15 under family-balanced weighting. The legacy labels admit 21/30 and 22/30 other-writer comparisons, respectively, while excluding 3/15 same-writer comparisons in both modes. These are descriptive counts, not validated accuracy estimates.

Supplied aggregate corpus diagnostic; pixel geometry and numerical labels retained. No individual writing-sample profile is displayed.

8. Reference sufficiency and the four-reference gate

The book-only profile uses three references and is below the four-reference gate. The mixed-reference sensitivity profile uses four references, but the 390-token candidate remains below the historical 400-token floor. Reaching four references does not cure the candidate-length shortfall, establish representativeness, or validate author identification.

9. Limitations and non-claims

Descriptive diagnostics only; exploratory convenience corpus; preliminary profiles. Missing or unreadable source material, transcription, excerpt selection and formatting may affect the supplied measurements. There is no calibrated author-identification inference, no proof of authorship, no human-versus-AI determination, and no forensic, legal, employment, academic or publication-use conclusion. No external verification or fresh engine execution is claimed.

10. Reproducibility and redaction notes

This is a redacted presentation derivative, not a byte-identical copy of the originals. Source identifiers and all feature-axis labels are excluded. No private decoder, feature-value table, contribution table or original image is embedded in the PDF or ZIP. Only cropped, permanently flattened plot interiors with generic headings are distributed. Plot pixels and retained aggregate results are unchanged; page layout is new. Geometry retains some information and may permit linkage to other material. Checks cover known names, protected labels, text, metadata, OCR, archive contents and visual presentation; they do not establish universal anonymity.

11. Conclusion

The retained shapes illustrate descriptive variation, not proof of a common author, a human-versus-AI finding or a validated identification method. Aggregate results remain inconclusive. The visual presentation preserves the interesting measurements while withholding the axis-label decoder, with residual geometric linkability expressly acknowledged.
